DNA was purified from a crude nuclear prep using Brassica oleracea TO1000DH3 buds provided by Thosmas Osborn at the University of Wisconsin. Genomic DNA was provided by Pablo Rabinowicz (CSHL) and the shotgun library prepared at Washington University Genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

//done libergrence: pSPORT1; Site 1: Not1; Site 2: Sal1; This conter interest was constructed from mRNA isolated from cDNA library was constructed from mRNA isolated from somatic embryos (age ranging from 2 months to 9 months) cultured on MSD 20. The library was prepared using the Life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a Not1 restrictions site. Sal1 linkers adapters were ligated to the blunt-ended cDNA fragments were directionally cloned into the Not1-Sal1 restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E.coli ElectroMax DH10B host cells. This library was constructed in the laboratory of Dr. Lila Vodkin by Anu Khanma at the University of Illinois at Urbana-Champaign. e-mail: l-vodkinguiuc.edu*

//octor.pBluescript II SK+; Site 1: ECORI; Site 2:
XhoI; The CDNA library was constructed from makua isolated
from mature seed pods of greenhouse grown plants prior to
sensecence for the cultivar KFI. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with a XhoI restriction site. ECORI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The CDNA fragments were
directionally cloned into the ECORI-XhoI restriction site
of the pBluescript vector. The ligated CDNA fragments
were transformed into DH10B host cells (GibcoBRL). This
library was constructed in the laboratory of Dr. Randy
Shoemaker."

XhoI; The cDNA library was constructed from mRNA isolated
from differentiating somatic embryos cultered on MSMGAC.
The library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with an XhoI restriction site. EcoRI adaptors were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were cransformed into E.coli BloctroMan DH10B host cells.
Tissue culture and library construction were performed by Francoise Thibaud-Nissen and Ann Khana (Lila Vodkin lab,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: est@watson.wustl.edu

Xhol; This cDNA library was constructed from mRNA isolated
from immature flowers of field grown plants. The cDNA
library was prepared using the Stratagene pBluescript II
XR library was prepared using the Stratagene pBluescript II
XR library was prepared using the Stratagene pBluescript (dT) sequence with a Xhol restriction site. EcoRI adapters
synthesized from mRNA using a primer consisting of a poly
(dT) sequence with a Xhol restriction site of the cloned into the EcoRI-Xhol restriction site of the pBluescript vector. The ligated cDNA fragments were
transformed into XL10-Gold host cells. This library was constructed by Dr. Randy Shoemaker and Dr. John
Erpelding."

Clones are derived from the bovine BAC library CHORI-240 (http://www.chori.org/bacpac/bovine240.htm). For BAC library availability, please contact Pieter de Jong (pdejong@mail.cho.org). Clones may be purchased from BACPAC Resources (http://www.chori.org/bacpac/ordering information.htm). This work was undertaken as part of the International Bovine BAC Mapping Consortium (IBBMC) by by University of Illinois at Urbana Champalagn, USA with funds provided by grant No. AG202-34480-11828 from USDA-CSREES and AG99-35205-8534 from USDA/NRI (Livestock Place: 134 row: H column: 2 Seg primer: SP6 Class: BAC ends.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC455370 405 bp DNA linear GSS 30-MAY-2003 SALK 081478.48.30.x Arabidopsis thaliana TDNA insertion lines Arabidopsis thaliana genomic clone SALK_081478.48.30.x, genomic

1 (Dassa 1 to 691)
Bash, W., Rabinowicz, P.D. and Wilson, R.K.
Whole genome shotgun reads from Brassica oleracea
Unpublished (2002)
Conteact: Richard K. Wilson
Genome Sequencing Center
Washington University School of Medicine
Email: submissions@watson.wustl.edu
Plate: maj94 row: d column: 12
Seq primer: -28RPpOT reverse
Class: shotgun
High quality sequence stop: 535.

Vector to vector length read

Vector to vector length is 533 This clone is available through:
ResGen, Invitrogen Corp. 2330 South Memorial Parkway Huntsville, AL
35301 For further information call: (800)-533-4363 or contact via
/tissue_type="somatic embryos cultured on MSD 20"
/lab host="DH1DB"
/clone_lib="Gm-clo36"
/clone_lib="Gm-clo36"
/note="vector: pSPORTL; Site_l: Notl; Site_2: Sall; This
cDNA library was constructed_from mRNA isolated from
somatic embryos (age ranging from 2 months to 9 months)
cultured on MSD 20. The library was prepared using the
Life Technologies pSuperScript cDNA library construction
kit. Complementary DNA was synthesized from mRNA using a
poly (dT) sequence with a Notl restrictions site. Sall
linkers adapters were ligated to the blunt-ended cDNA
fragments followed by Notl digestion. The CDNA fragments
were directionally cloned into the Notl-Sall restriction
site of the pSPORTI vector. The ligated cDNA fragments
were directionally cloned into the laboratory of Dr. Lila
This library was constructed in the laboratory of Dr. Lila
Vodkin by Anu Khanna at the University of Illinois at
Urbana-Champaign. e-mail: l-vodkin@uic.edu"

//lote="Vector: pBluescript II SK+; Site 1: BcoRI; Site 2:
XhoI; The CDNA library was constructed from mRNA isolated
from mature seed pods of greenhouse grown plants prior to
senescence for the cultivar XPI. Complementary DNA was
synthesized from mRNA using a primer consisting of a
poly (dT) sequence with a XhoI restriction site. BcoRI
adapters were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The CDNA fragments were
followed by XhoI digestion. The CDNA fragments were
followed by XhoI digestion. The Income is the pBluescript vector. The ligated cDNA fragments
were transformed into DH10B host cells (GibcoBRL). This
library was constructed in the laboratory of Dr. Randy
Shoemaker."

RESULT 9 CD391412 LOCUS

ACCESSION

```
from differentiating somatic embryos cultered on MSM6AC.
The library was prepared using the Stratagene pBluescript
II SK(+) library construction Kit. Complementary DNA was
synthesized from mRNA using a primer consisting of a
synthesized from mRNA using a primer consisting of a
poly(dT) sequence with an XhoI restriction site. EcoRI
adaptors were ligated to the blunt-ended cDNA fragments
followed by XhoI digestion. The cDNA fragments were
directionally cloned into the ECORI-XhoI restriction site
of the pBluescript vector. The ligated cDNA fragments
were transformed into E.coli ElectroMax DHIOB host cells.
Tissue culture and library construction were performed by
Francoise Thibaud-Nissen and Ann Khana (Lila Vodkin lab,
University of Illinois)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Contact: Shoemaker R/Public Soybean BST Project

/clone_lib="soybean induced by Salice_1: EcoR I; Site_2:
/clone_lib="soybean induced by Salicylic acid for 24, 36, 48
and 72 h. Complementary DNA was synthesized from mRNA
using a primer consisting of a poly(dr) sequence with a
xhol striction site. EcoR1 adapters were ligated to the
blunt-ended CDNA fragments followed by Xhol digestion. The
CONA fragments were directionally cloned into the
EcoR1.Xhol restriction site of the pBluescript vector. The
ligated cDNA fragments were transformed into XL1-Blue MRP'
host cells (Stratagene)."

This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.
This sequence is from a Xenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.
GDNA was oligo dT primed from 5ug of poly A+ RNA from stages 10-13
gastrulae. ECORI-NotI cut cDNA was then ligated into pCS107 with
ECORI at the 5' end and NotI at the 3' end.
Vector: pCS107; Site 1: ECORI; Site 2: NotI
HGST: Escherichia coli XII- blue.

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte, (2) an isolated nucleic acid containing a specifically binding sequence that is bound specifically by the protein, and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistence operon of S. coli) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the mucleic acid in the presence of the analyte. Also included are a biosensor device for an analyte in a sample, at a cample, and an Arsk (encoded by part of the arsenic resistance operon of E. coll) protein comprising an amino acid sequence appearing as ABU63440 binding to a mucleic acid sequence appearing as ABU63440 binding to a mucleic acid sequence comprising oligonucleorides appearing as ACD28581. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleoride which binds to a plasmid expressed Arsk protein and is used in the biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel human secretory or membrane proceins (ADAS4072-ADAS5710) and their coding sequences (ADAS433-ADAS401). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention relates to a Moraxella catarhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarhalis (Branhamella catarhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarhalis is known to cause acute, localised infections such as otticis media, sinustis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                   Genomic library for identifying diagnostic and therapeutic compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic acids.
                                                                                                                             Claim 1; Page 486-545; 545pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                and meningitis

Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polymucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.

Claim 1; SEQ ID NO 10855; 489pp; English

The present invention describes a composition (I) comprising: carriers and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polymucleotide (III) having a cDNA sequence (SI) from the 10912 nucleotide sequences as given in ABL/7023 to ABLB/7934, (III) encoding (II) having a sequence (S2), a T cell population of (II), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological 

sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comparing the amount to a predetermined cutoff value and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is useful for stimulating and/or expanding T cells with (III) or (II). (III) is useful in design and preparation of ribozyme molecules for inhibiting to isolate a full length gene from a suitable library e.g., a tumour cells; and library using well known techniques

Bush D; Doucette-Stamm LA,

WPI; 2002-381255/41. P-PSDB; ABP39987 Novel isolated nucleic acid encoding a Staphylococcus epidermis polypeptide, useful for diagnosing and treating bacterial infections

Disclosure; SEQ ID NO 1995; 267pp; English.

ABN99538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site

The invention relates to an enzyme exhibiting endo-beta-1,4-glucanase activity (EC 3.2.1.4), comprising: (a) a polypeptide encoded by the DNA sequence appearing as ABX11841; (b) a polypeptide produced by culturing a cell comprising the DNA sequence under conditions where the DNA sequence is expressed; (c) an endo-beta-1,4-glucanase enzyme having at least 97% sequence identity to the amino acid sequence appearing as ABG76403; or (d) a polypeptide having endo-beta-1,4-glucanase activity that is encoded by a polymucleotide that hybridizes to the DNA under hybridisation conditions comprising 5X SC at 45 plusoc and washing conditions comprising 5X SC at 45 plusoc and washing conditions comprising by a polymucleotide construct comprising may of the DNA sequence, a polymucleotide construct comprising any of the DNA sequence.

The expression vector (comprising the following operably linked elements: a transcription terminator), a cultured cell comprising the vector and compressing the enzyme, a method for degradation of cellulose-containing biomass that is treated with the enzyme or enzyme composition cited above and a hybrid endo-glucanase (exhibiting endo-beta-1,4-glucanase activity comprising the cellulase binding domain, CBD, of the enzyme, and a catalytic domain (CAD) from sources other than Bacillus sp. AA349 strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New enzyme exhibiting endo-beta-1,4-glucanase activity, useful in detergent compositions, oil industry textile finishing processes, biomass degradation, laundry, and stone washing.
                                                                                                                                                                                                                                                                                                                                          Gene, ds; endo-beta-1,4-glucanase; detergent; textile finishing process; oil industry; biomass degradation; laundry; stone washing; pulp processing; animal feed.

The invention relates to a mutant alkaline cellulase derived from the Bacillus sp. KBM-S237 alkaline cellulase Bg1-237 (ABS71407). The mutant enzyme is created by deleting one or more amino acid residues between residues 343-373 of the wild-type enzyme, and then inserting a 2-15 residue peptide into the deletion site. The invention also encompasses a gane encoding a mutant alkaline cellulase of the invention, and vectors and host cells comprising a matent alkaline cellulase-encoding gene. The wery close to the pu of laundry water (around pil 10.5) and are therefore useful as enzymes for detergents. The present sequence represents the gene encoding wild-type Bacillus sp. KSM-S237 alkaline cellulase Eg1-237.

Mutated alkaline cellulase for use as an enzyme for detergents is produced by deleting one or more amino acid residue groups from the 3·to 3/3-positions in SEQ ID No:1 and then inserting a peptide into the

ö
DSM12648). The enzymes are useful in detergent composition, textile finishing processes, oil industry, biomass degradation, laundry and stone washing. The invention provides enzymes having substantial beta-1,4-glucanase activity under slightly acid to alkaline conditions and improved performance in pulp processing, textile treatment, laundry processes, extraction processes or in animal feed. The present sequence encodes the endo-beta-1,4-glucanase. (Updated on 27-OCT-2003 to standardise OS field)

```
By using this DNA sequence cellulase can be produced. This cellulase hydrolyses cellotriose or cellotetrose and does not hydrolyse cellobiose. Molecular weight is approx. 92K dalton and optimum pH is 9. (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA sequence coding cellulase gene - is derived from Bacillus sp. z and can hydrolyse cello-triose and cello-tetrose.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel alkaline cellulase gene from a Bacillus sp. The alkaline cellulase gene is used for the preparation of an aklaline cellulase useful as a textile detergent and a textile treating agent. This sequence encodes the Bacillus sp. alkaline cellulase N131b described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alkaline cellulase gene useful for the preparation of an alkaline cellulase useful as a textile detergent and a textile treating agent.

The invention relates to microorganisms (particularly Bacillus species)

in which one or more sporulation-associated genes active in the medium to
latter stages of sporulation have been deactivated or deleted. Such genes
include the sigE, sigF, spoilE, spoilEs, sigG, spoiVCB and spoilE genes
include the sigE, sigF, spoilEs, sigG, spoiVCB and spoilE genes

the invention also relates to the recombinant production of a protein

the invention are incapable of producing spores, recombinant protein

production is more efficient, with reduced formation of by-products,

teduced energy loss, reduced consumption of culture medium, and increased

speed of target protein production. In addition, protein production can
be efficiently carried out over a longer period of time than is currently
the case. The microorganisms can be used to recombinantly produce target

proteins for use in a variety of applications, such as in foodsruffs,
drugs, cleaning agents and toiletries. The present sequence represents a

satillus sp. KSM-S237 sporulation-associated gene related to the
live invention. Note: The present sequence is siting,
but is not further referred to in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacillus strain having genes associated with sporulation inactivated for use as hosts in more efficient production of recombinant proteins.

Bacillus sp. KSM-S237 heat resistant alkaline cellulase DNA.

Heat resistant alkaline cellulase; detergent; cleaning application; ds.

Bacillus sp. KSM-S237.

JP2000210081-A

ö The invention relates to a novel heat resistant alkaline cellulase (AAB23180) from Bacillus sp. KSM-S237, and to the gene encoding it (AAB437493). The invention also encompasses variants of the hear resistant alkaline cellulase in which at least one amino acid residue is deleted, replaced or inserted. The Bacillus sp. KSM-S237 heat resistant alkaline cellulase gene was isolated using the Bacillus sp. No. 1139 alkaline cellulase gene derived PCR primers AAB37494-A97495. The Bacillus sp. KSM-S237 heat resistant alkaline cellulase gene can be used for the forcamilated in detergent for cleaning applications. The present sequence represents the Bacillus sp. KSM-S237 heat resistant alkaline cellulase which can be formulated in detergent for cleaning applications. The present sequence Gaps ö Query Match 77.4%; Score 17.8; DB 3; Length 3189; Best Local Similarity 90.5%; Pred. Bacillus strain having genes associated with sporulation inactivated for use as hosts in more efficient production of recombinant proteins.

Disclosure; Page 20-25; 29pp; Japanese.

The invention relates to microorganisms (particularly Bacillus species)
in which one or more sporulation-associated genes active in the medium to
clatter stages of sporulation have been deactivated or deleted. Such genes
include the sigh, sigh spoils, spoils, sigh, spoilsd and spoiling genes
include the sigh, sigh spoils.

The invention also relates to the recombinant production of a protein
cusing the microorganism of the invention. As the microorganisms of the
invention are incapable of producing spores, recombinant protein
confuced energy loss, reduced consumption of culture medium, and increased
conformation is more efficient, with reduced formation of by-products,
creduced energy loss, reduced consumption of culture medium, and increased
conformation is more efficient, with reduced formation of by-products,
creduced energy loss, reduced consumption of culture medium, and increased
conformation is more efficient, with reduced formation of time than is currently
the case. The microorganisms can be used to recombinantly production can
be efficiently carried out over a longer period of time than is currently
the case. The microorganisms can be used to recombinantly product far,
creduced. Consumption of culture sequence represents a
conduction sequence is given in the sequence listing, but is not
continued to in the specification

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a charge in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of a analyte in a sample, detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the areance resistance operon of B. Coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte, (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein, and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, detecting the arsenic resistance operon of B. coll) protein comprising an main acid sequence that is at least 90% identical to amino acids 1.97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid sequence comprising oligonucleotides appearing as ACD28564-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a consistence of the analyte in a sample of consistence of analyte analyte analyte and an analyte of the consistence of the consist
                                                                                                                                                                                                                                                                        ö
sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds to a chromosomally expressed ArsR protein and is used in the biosensor of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Also included are a biosensor device for detecting the presence of the analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistance operon of E. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising oligonucleotides appearing as ACD28594-ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of analyte in a sample. The

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the analyte; (2) an isolated nucleic acid containing a specifically by the protein; and (3) a detection system that indicates a change in binding of the protein; and containing a containing and to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte and an ArsR (encoded by part of the arsenic resistance operon of B. coll) protein comprising an amino acid sequence that is at least 90% indentical to amino acids 1-97 of the ArsR sequence appearing as ABUG3440 binding to a nucleic acid sequence comprising or ligonucleotides appearing as ACD28584+ACD28591. The system is useful for detecting the presence of analyte in a sample. The present sequence is the top strand of an oligonucleotide which binds to a chromosomally expressed ArsR protein and is used in the biosenar of the New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample. New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 1; SEQ ID NO 3339; 1766pp; English

The invention relates to an isolated nucleic acid comprising any one of the first antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid conditions a promoter operably linked to the nucleic acid conditions a promoter operably linked to the nucleic acid conditions are conditions and propertied whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the conformation; (4) identifying a gene in an operan required for proliferation or the activity of agene in an operan required for cellular proliferation; (8) inhibits and activity of required for proliferation or that has an activity against a biological pathway in which a proliferation-required gene or its gene product is equipment of an organism acts; (9) manufacturing an antibiots; (10) profiling a compound's activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism sis present in a culture or collection of a proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids are useful for the callular proliferation in cells other candidate molecules for rational cradised for proliferation in cells other than S. aureus, S. typhimurium, cradised for proliferation in cells other than S. aureus, S. typhimurium, antisense sequences of the invention. Note: The sequence details of the invention of an organism of the properties are genenced to the properties of the invention. Note: The sequence of the invention of an organism of the invention of the properties of the invention of the properties of the invention of the properties of the invention of the condit

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transpenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; immune system disease; cytosine methylation; antiasthmatic; antiarteriosclerotic; antianaemic; cytostatic; nootropic; entropy anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antiinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AlDS; epilepsy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food of sites expressing (II). (I) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of pulypeptide and polymucleotide sequences have applications in diagnostics, foremsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and and not appear in the printed specification, but was obtained in clear of the invention. Note: The sequence data for this classification, but was obtained in the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to novel tumour suppressor gene, referred to as Lmt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt intron 3 DNA.
                                                                                                                                                                                                                                           Seguence 62782 BP; 15441 A; 9614 C; 9374 G; 14439 T; 0 U; 13914 Other;
             New nucleic acid molecule, useful for screening a subject for the presence of an aberration in a gene encoding an LMT.

                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid rebuxemia, Alzheimer's disease, Alzheimer's disease, Alzheimer's disease, and inflammatoriy ucurofibromatosis, rheumatoic arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention

The invention relates to novel tumour suppressor gene, referred to as Imt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an IMT. The present sequence is human Imt intron 2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel tumour suppressor gene, referred to as Lmt. The invention also relates to the field of cancer therapy and cancer diagnostics. The nucleic acid molecule is useful for screening a subject for the presence of an aberration in a gene encoding an LMT. The present sequence is human Lmt reverse complement DNA

The invention relates to novel genes (ABA11004-ABA21534) and proteins C (ABB14678-ABB18001) useful for preventing, treating or ameliorating conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and overtain cencer and other cancers of the adrenal gland, bone, bore marrow, breast, gastrointestinal tract, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as mycocardial isohaemias; (d) wound healing infectious diseases such as mycocardial isohaemias; (d) wound healing infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of infections. Note: The sequence data for this patent did not form part of from WIPO at ftp.wipo.int/pub/published pot\_sequences

Sequence 3389, Application US/09328352

Patent No. 6562958

GENERAL INFORMATION:
APPLICAMT: Gary L. Breton et al.
APPLICAMT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BADMANNII FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: BADMANNII FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252

SEQ ID NO 3389
ILENGTH: 2481
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Sequence 2280, Application US/09422978

Sequence 2280, Application US/09422978

Patent No. 6537751

GENERAL INFORMATION:

APPLICANT: Cohen, Daniel

APPLICANT: Chumakov, Ilya

APPLICANT: Chumakov, Ilya

TILLE OF INVENTION: Biallelic markers for use in constructing a high density...

FILE REPERENCS: GENSET.020C21

CURRENT APPLICATION NUMBER: US/09/422,978

CURRENT PILING DATE: 1999-10-20

EARLIER APPLICATION NUMBER: US 60/109,732

EARLIER APPLICATION NUMBER: US 60/109,732

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English.

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated uncleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and the arsenic resistance operon of E. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the ArsR sequence appearing as ABU63440 binding to a nucleic acid

```
sequence comprising oligonucleotides appearing as ACD28584-ACD28591. The system is useful for detecting the presence of analyre in a sample. The present sequence is the top strand of an oligonucleotide which binds to plasmid expressed Arsk protein and is used in the biosensor of the

New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of analyte in a sample.

Claim 35; Page 15; 36pp; English

The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte, (2) an isolated nucleic acid containing a specific binding sequence that is bound specifically by the protein; and (3) a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, detecting the presence of an analyte in a sample, and are a resence of an analyte in a sample, and are a sample to part of the arsenic resistance operon of E. coli) protein comprising an amino acid sequence appearing as Au63440 binding to a nucleic acid sequence appearing as Au63440 binding to a nucleic acid sequence appearing the presence of analyte in a sample. The system is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligomuleoride which binds to be a plasmid expressed ArsR protein and is used in the biosensor of the

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, solid tumors or cancer.

Claim 1; SEQ ID NO 11; 32pp; English.

The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of \$46 sequences, and an oligomer that hybridises to or is identical or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosting or tracting diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, themerchlogical disorders, immunological disorders, waardenburg neurological disorders, immunological disorders, waardenburg contraction, hypertension, angiogenesis, eythtropolesis, congenital heart disease, HDR syndrome, architis, polyglutamine disorders, solid tumours or cancer. Sequences ABX28127-ABX28472 represent DNA transcription associated genomic DNA molecules of the printed specification but was obtained in electronic format directly from the European Patent

Isolated nucleotide sequences of Neisseria meningitidis which can be in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea.

Claim 7; Page 253-260; 1760pp; English.

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA8244 represent corresponding to the AA81250 to AAA81260 to AAA81263 to AAA81260 to AAA81263 and AAA812650 to AAA81265 represent Neisseria DNA sequences and their corresponding proteins; AAA8125 to AAA81259 and CAAA8124 trepresent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA8125 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all cused in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the exemple, some of the manufacture of a medicament (or treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all corpus Meningococcus B cyanism-specific probes Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent corpusing neringenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins chart may be presumed targets for the immune system and which are not antigenic allocations.

The present invention describes the full length genome of Neisseria meningitidis B (NWB). The sequences in AAF21544 and AAF21607 to AAF21613 cepresent fragments of the NWB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each sequence by 49980 bp (1.e. the last 49980 bp of AAF21541 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21547 is repeated at the beginning of AAF21609, and so on). AAF21545 to AAF21580 encode the Neisseria proteins or primers which are used in the exemplification of the present invention. The NWB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria. Computer storage medium or computer databases can be used in a search to identify open reading frames (ORFS) or coding sequences within the NWB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the concept of the proteins which have more effective in vaccines than the concept on the proteins which are more effective in vaccines than the

Jones

Harlocker SL,

The present invention describes a composition (1) comprising: carriers and annual and a polypeptide (III) of a ovarian tumnour prolypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1) from the 10912 nucleotide sequences as given in AB177021 to AB187934, (III) encoding (III) having a sequence (S2), a T cell population of (III), or antigen presenting cells that express (III) (I) has cytostatic activity. An oligonucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably carryidising to (IV) and comparing the amount of polynucleotide hybridising to (IV) and comparing the amount of polynucleotide hybridising to (IV) is detected preferably by an and comparing the amount of polynucleotide hybridising to (IV) is detected preferably by useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells specific for an ovarian tumour protein comprising contacting T cells specific for an ovarian useful in design and preparation of fiboxyme molecules for inhibiting useful in design and preparation of fiboxyme molecules and proteins in tumour cells; and to isolate a full length gene from a suitable library e.g., a tumour colNNA Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing Claim 1; SEQ ID NO 10855; 489pp; English library using well known techniques

E. coli ArsR binding oligonucleotide PLASSIB. (first entry)

10-OCT-2003

ArsR; arsenic resistance operon; biosensor; ss; arsenic.

```
The invention relates to a new system (biosensor) for detecting the presence of analyte in a sample comprising: (1) an isolated protein that presence of analyte in a sample comprising: (1) an isolated protein that specifically binds the analyte; (2) an isolated nucleic acid containing a specifically binds the analyte; (2) an isolated nucleic acid in the presence of the analyte. Also included are a biosensor device for detecting the presence of the analyte. Also included are a biosensor device for detecting the presence of an analyte in a sample, are the arsenic resistance operon of B. coll) protein comprising an amino acid sequence that is at least 90% identical to amino acids 1-97 of the Arsk sequence appearing as ABC63440 binding to a nucleic acid the Arsk sequence appearing the presence of analyte in a sample. The system is useful for detecting the presence of analyte in a sample. The speam is useful for detecting the presence of analyte in a sample. The present sequence is the bottom strand of an oligonucleotide which binds is a sample.
                                                                                                                                                                                                                                                                                                                                                   New system comprising isolated protein and nucleic acid, and a detection system that indicates a change in binding of the protein to the nucleic acid in the presence of the analyte, useful for detecting the presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 35; Page 15; 36pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                       New Acinetobacter baumanii proteins and mucleic acids, useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for
                                                                                                                                                                                                                   The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents DNA encoding an A. baumannii
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a miniature inverted-repeat transposable element (MITE)-like element capable of causing duplication of a target asquence at the site of its insertion in a genomic gene. The invention is useful for causing expression of a transgene in a plant. It can also be used for inducing or regulating the expression in a plant of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel miniature inverted-repeat transposable element (MITE)-like element useful for constructing transgene expression cassette for stably creating genetically engineered organisms capable of expression of transgene.
                           18
The invention relates to an isolated mucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences

Designing primers and probes for analyzing diseases associated with cytosine methylation state e.g. arthritis, cancer, aging, arteriosclerosis comprising fragments of chemically modified genes associated with cell cycle.

Claim 1; SEQ ID NO 79; 28pp; English.

Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for and/or epigenetic parameters, the differences serving as basis for The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, aging, glomerular disease, Lewy body disease, arthritis, arteriosclerosis, solid tumours and cancers

(EPIG-) EPIGENOMICS AG

Berlin K; Dlek A, Piepenbrock C,

WPI; 2001-602752/68

Fragments of chemically modified genes associated with tumor suppressor genes and oncogenes, useful in designing primers and probes for analyzing diseases associated with cytosine methylation state e.g. cancer.

Claim 1; SEQ ID NO 119; 27pp; English

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid—oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single culleotide polymorphisms and also to be used in an array for analysing diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or proposition to specific diseases, by analysing chiseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of cytosine methylations. The parameters may be compared to another set of partients and/or epigenetic parameters may be compared to another set of partients. The present sequence is one of the 533 genomic sequences can enter the form the parameters and oncogenes. Note: The sequence data for this patent did not form at of the printed specification, but was obtained in electronic form at diseases. ftp.wipo.int/pub/published\_pct\_sequences

                                                                                                                                                                            /note="Vector: pBluescript II SK-, Site_I: EcoRI; Site_2: Aholf This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in the ambient levels of CC2 and HS medium bubbled with 5½ CO2 PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5′) and XhoI (3′) sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with Exassist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6; 791-806."

This clone is from an A. gambiae BAC library (ND-TAM) provided by
This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
the minimize the inclusion of DNA from micrororganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&W Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
Seq primer: MI3 Rev
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Anopheles.
